Professional Profile

MS in Information Systems and Technology candidate (**4.0 GPA**, May 2026) with 2 years of prior software engineering experience in Python and Java. Recently **built an LLM-powered incident-triage service** end to end, covering the retrieval pipeline, orchestration, and a React dashboard, using AI coding agents. Earlier shipped Kafka workflows and async REST microservices on Kubernetes and AWS, including a 20M-record migration with zero data loss.

Education

Master of Science in Information Systems and Technology

University of North Texas, Denton, TX

GPA: 4.0

August 2024 - May 2026

Bachelor of Technology in Electronics and Telecommunications

MKSSS Cummins College of Engineering, Pune, India

GPA: 3.3

August 2018 - May 2022

Experience

Amdocs - Full Time

Aug 2022 - Jul 2024

Software Developer

Pune, Maharashtra

- Designed and built Kafka-based migration workflows that transferred **20 million records** across environments with zero data loss while keeping services available.
- Containerized and deployed services with **Docker, Kubernetes and Helm**, automating deployment workflows to reduce infrastructure-related incidents.
- Monitored production microservices with **Prometheus, Grafana and ELK** triaging incidents, running **root-cause analysis**, and shipping permanent fixes to improve **reliability**.
- Debugged and resolved customer-reported issues by **reproducing defects in Kubernetes environments** and releasing validated patches that reduced recurring incidents by up to 10%.
- Participated in **code reviews** and collaborated with cross-functional **Scrum teams (Agile, Jira)** to ship features on schedule.
- Recognized as **Employee of the Quarter** for system-design improvements and remediation of critical security CVEs by creating an automation that reduced manual fixing effort.

University of North Texas

Aug 2025 – May 2026

Teaching Assistant

Denton, TX

- Assisted and managed **350 students** with Hadoop, Hive, Spark and data analytics concepts through technical assistance.
- Supported student learning through assignment evaluation, technical mentoring and problem solving assistance for coursework.

Technical Skills

Languages: Python, Java, JavaScript, SQL, React

Backend & Distributed Systems: REST APIs, DRF, Microservices Architecture, Django, OOP, Spring Boot, Kafka, Event-Driven Architecture, Data Structures & Algorithms

Databases: PostgreSQL, MySQL, Cassandra, Elasticsearch

Cloud & Infrastructure: AWS, Docker, Kubernetes, Helm, Linux, CI/CD

Monitoring & Tools: Prometheus, Grafana, ELK Stack, Git, GitHub, Bitbucket, Postman, Pytest

AI & LLM: LLM Application Development, RAG, LangChain, Cursor

Projects

Amdocs – Bulk Api Integration

Aug 2022 – Jul 2024

- Built bulk-api, a microservice exposing **asynchronous bulk REST APIs** (create, update, delete, count, export, import) for large-scale telecom service inventory data, within ONI (Amdocs NEO, OSS domain).
- Processed **large bulk payloads** in configurable batches to sustain high throughput without exhausting service memory.
- Worked on event-driven backend services using **Kafka and Cassandra** for high volume asynchronous processing, deployed across a platform of 9+ Kubernetes microservices on AWS.

Incident Co-pilot

June 2026

- Built incident-copilot, a Python/FastAPI service that diagnoses outages from a time window alone, **reaching 0.85 confidence on a DB-down fault**, developed with AI coding agents (Cursor, Claude) using targeted prompts and careful review.
- Developed a React dashboard surfacing the triage pipeline's output, live incident timeline, confidence scores, and cited RCA evidence, using component-driven state management to turn raw diagnostic data into a readable, filterable view.
- Designed a three-stage diagnostic pipeline (Collector, Context Builder, Analyzer) with typed Pydantic contracts, a configurable **lookback buffer** to capture pre-symptom causes and graceful degradation when dependencies are unreachable, compressing **3,700+ raw log entries into a 450-token context** under a hard budget.

AWS Based Serverless Financial Portfolio Management Architecture

April

2026

- Delivered a **serverless AWS architecture proposal** (S3, Lambda, API Gateway, DynamoDB, CloudFront) for a client's financial portfolio management platform.
- Covered capacity planning, disaster-recovery design and cost modeling against a **200K MAU target**, with the solution being recognized in the client's technical review.
